BAYREUTH

# Overview

JSXGraph - A short overview

Computing plane loci using Groebner bases

Implementing this algorithm in JSXGraph

Optimizations

Examples

```
</script>  
</html>  
  
var brd = JSXGraph.initBoard('box', {ax:  
var s = brd.createElement('slider', [[1,3], [5  
var a = brd.createElement('slider', [[1,2], [5  
var b = brd.createElement('slider', [[1,1], [5  
var f = function(x){ return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
  
var os = brd.createElement('riemannsum', {f:  
function(){ return s.Value(); }  
function(){ return a.Value(); }  
function(){ return b.Value(); }  
},  
{fillColor: '#ffff00';
```

UNIVERSITÄT  
BAYREUTH

# JSXGraph

```
<script src="/javascript">  
var brd = JSXGraph.initBoard('box', {ax:  
var s = brd.createElement('slider', [[1,3],[5  
var a = brd.createElement('slider', [[1,2],[5  
var b = brd.createElement('slider', [[1,1],[5  
var f = function(x){ return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f  
function(){ return s.Value(); }  
function(){return a.Value(); }  
function(){return b.Value(); }  
},  
{fillColor:'#ffff00'
```

# JSXGraph

## What is JSXGraph?

- ▶ A library implemented in JavaScript
- ▶ Runs in recent versions of all major browsers
- ▶ No plugins required
- ▶ LGPL-Licensed

## Main features

- ▶ Dynamic Geometry
- ▶ Interactive function plotting
- ▶ Turtle Graphics
- ▶ Charts

```
<script src="/js/javascript">  
var brd = JSXGraph.initBoard('box', {ax:  
var s = brd.createElement('slider', [[1,3], [5  
var a = brd.createElement('slider', [[1,2], [5  
var b = brd.createElement('slider', [[1,1], [5  
var f = function(x) { return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f:  
function() { return s.Value(); }  
function() { return a.Value(); }  
function() { return b.Value(); }  
},  
{fillColor: '#ffff00';
```

## Supported Hardware

- ▶ PC (Windows, Linux, Mac)
- ▶ "Touchpads" like the Apple iPad
- ▶ Mobile phones, iPod
- ▶ Basically every device which runs at least one of the supported browsers

```
<script type="text/javascript">  
var s = JSXGraph.initBoard('box', {ax:  
var a = brd.createElement('slider', [[1,3], [5  
var b = brd.createElement('slider', [[1,2], [5  
var f = function(x) { return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f:  
function() { return s.Value(); }  
function() { return a.Value(); }  
function() { return b.Value(); }  
},  
{fillColor: '#ffff00';
```

## Supported Browsers

- ▶ Firefox
- ▶ Chrome/Chromium
- ▶ Safari
- ▶ Internet Explorer
- ▶ Opera

```
<script src="/javascript">  
var brd = JSXGraph.initBoard('box', {ax:  
var s = brd.createElement('slider', [[1,3],[5  
var a = brd.createElement('slider', [[1,2],[5  
var b = brd.createElement('slider', [[1,1],[5  
var f = function(x){ return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f  
function(){ return s.Value(); }  
function(){ return a.Value(); }  
function(){ return b.Value(); }  
},  
{fillColor:'#ffff00'
```

## Example/Input

```
<link rel="stylesheet" type="text/css" href="css/jsxgraph.css" />
<script type="text/javascript" src="js/jsxgraphcore.js"></script>
...
<div id="jxgbox" class="jxgbox" style="width:500px; height:500px;"></div>
<script type="text/javascript">
    board = JSXGraph.initBoard('jxgbox', {boundingbox: [-2, 20, 20, -2], axis:
        true, grid: false, keepaspectratio: true});
    A = board.create('point', [8, 3]);
    B = board.create('point', [8, 8]);
    c1 = board.create('circle', [B, 4]);
    D = board.create('glider', [0, 0, c1], {name: 'D'});
    g = board.create('line', [A, D]);
    c2 = board.create('circle', [D, 3]);
    T = board.create('intersection', [c2,g,0], {name: 'T'});
</script>
```

## Example/Output

## Supported file formats

- ▶ GEONE<sub>x</sub>T
- ▶ GeoGebra
- ▶ Intergeo
- ▶ Cinderella (small feature subset)

```
<script src="/js/jsxgraph.js">  
var brd = JSXGraph.initBoard('box', {ax:  
  var a = brd.createElement('slider', [[1,3],[5  
  var b = brd.createElement('slider', [[1,2],[5  
  var f = function(x){ return Math.sin(x); }  
  var plot = brd.createElement('functiongraph',  
  var os = brd.createElement('riemannsum', {f:  
    function(){ return s.Value(); }  
    function(){ return a.Value(); }  
    function(){ return b.Value(); }  
  },  
  {fillColor:'#ffff00'
```

## Example/Input

```
<link rel="stylesheet" type="text/css" href="css/jsxgraph.css" />
<script type="text/javascript" src="js/jsxgraphcore.js"></script>
...
<div id="jxgbox" class="jxgbox" style="width:500px; height:500px;"></div>
<script type="text/javascript">
    board = JXG.JSXGraph.loadBoardFromFile('jxgbox', 'watt.xml', 'intergeo');

    function computeLocus() {
        board.create('locus', [JXG.getRef('T')]);
    }
</script>
```

## Example/Output

## Computing plane loci using Groebner bases (in a nutshell)

```
<script src="/javascript">  
var brd = JSXGraph.initBoard('box', {ax:  
var s = brd.createElement('slider', [[1,3],[5  
var a = brd.createElement('slider', [[1,2],[5  
var b = brd.createElement('slider', [[1,1],[5  
var f = function(x){ return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f:  
function(){ return s.Value(); }  
function(){return a.Value(); }  
function(){return b.Value(); }  
},  
{fillColor:'#ffff00'
```

# Computing plane loci using Groebner bases

- Given a set of free and dependent points,

# Computing plane loci using Groebner bases

- ▶ we first choose a coordinate system,

# Computing plane loci using Groebner bases

- ▶ translate geometric constraints into an algebraic form,

- ▶  $(u[1] - 8)^2 + (u[2] - 8)^2 - 16 = 0$

- ▶  $(x - u[1])^2 + (y - u[2])^2 - 9 = 0$

- ▶  $3x - 3u[1] + yu[1] - 8y + 8u[2] - xu[2] = 0$

# Computing plane loci using Groebner bases

- ▶ calculate the Gröbner basis of the given ideal,

- ▶ 
$$x^6 + 3x^4y^2 + 3x^2y^4 + y^6 - 48x^5 - 38x^4y - 96x^3y^2 - 76x^2y^3 - 48xy^4 - 38y^5 + 1047x^4 + 1216x^3y + 1774x^2y^2 + 1216xy^3 + 727y^4 - 13024x^3 - 16596x^2y - 16096xy^2 - 8404y^3 + 97395x^2 + 109888xy + 63535y^2 - 415536x - 300806y + 790009 = 0$$

# Computing plane loci using Groebner bases

- ▶ and finally plot the calculated implicit equation.

## Implementing this algorithm in JSXGraph

```
<script type="text/javascript">  
var brd = JSXGraph.initBoard('box', {ax:  
var s = brd.createElement('slider', [[1,3],[5  
var a = brd.createElement('slider', [[1,2],[5  
var b = brd.createElement('slider', [[1,1],[5  
var f = function(x){ return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f:  
function(){ return s.Value(); }  
function(){return a.Value(); }  
function(){return b.Value(); }  
},  
{fillColor:'#ffff00'
```

# Implementation

## Problems

- ▶ No JavaScript implementation of any Gröbner basis algorithm
- ▶ Can't use C-libraries directly in JavaScript
- ▶ No implicit plotting in JSXGraph by now

```
</script>  
</div>  
<div id="JSXGraph" style="border: 1px solid black; padding: 10px; width: 100%; height: 100%; position: relative; background-color: #f0f0f0;">  
  <div style="position: absolute; top: 10px; left: 10px; font-family: monospace; font-size: 0.8em; color: #000080; pointer-events: none;">  
    <div style="display: flex; justify-content: space-between; width: 100%; margin-bottom: 5px;">  
      <div>var s = JSXGraph.initBoard('box', {ax:  
    </div>  
      <div>var a = brd.createElement('slider', [[1,3],[5  
    </div>  
      <div>var b = brd.createElement('slider', [[1,2],[5  
    </div>  
      <div>var f = function(x){ return Math.sin(x); }  
    </div>  
      <div>var plot = brd.createElement('functiongraph',  
    </div>  
    </div>  
    <div style="display: flex; justify-content: space-between; width: 100%; margin-top: 5px;">  
      <div>var os = brd.createElement('riemannsum', {f:  
    </div>  
      <div>function(){ return s.Value(); }  
    </div>  
      <div>function(){ return a.Value(); }  
    </div>  
      <div>function(){ return b.Value(); }  
    </div>  
    </div>  
    <div style="display: flex; justify-content: space-between; width: 100%; margin-top: 5px;">  
      <div>{fillColor: '#ffff00';  
    </div>  
    </div>  
  </div>  
</div>
```

# Implementation

## AJAX

- ▶ Transfer data (a)synchronously via HTTP with JavaScript

## This enables us to

- ▶ use a computer algebra system on a (web) server for the expensive Gröbner basis calculations
- ▶ use a plotting tool/library for implicit plotting

# Client

Return plot and draw it using JSXGraph

## AJAX

# Server

Several software packages are used server side:

python™ is used to retrieve the data and pass it on to

CoCoA handles the symbolic algebra stuff and returns a set of polynomials which are plotted with the python library

# matplotlib

Finally the locus curve is extracted as a list of coordinates from the plots and is sent back to JSXGraph where the data is used to plot the locus directly in the geometric construction.

UNIVERSITÄT  
BAYREUTH

# Implementation

## Example/Input

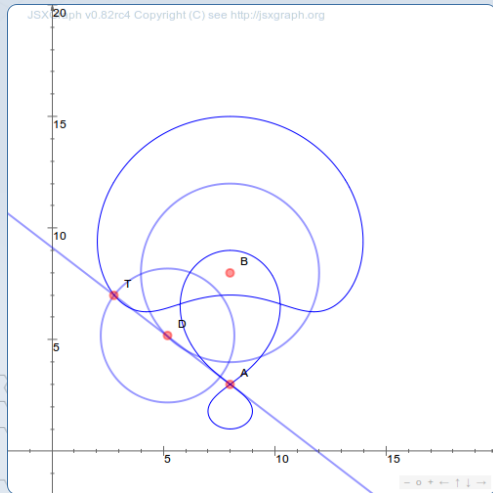

```
<link rel="stylesheet" type="text/css" href="css/jsxgraph.css" />
<script type="text/javascript" src="js/jsxgraphcore.js"></script>
...
<div id="jxgbox" class="jxgbox" style="width:500px; height:500px;"></div>
<script type="text/javascript">
  board = JXG.JSXGraph.initBoard('jxgbox', {boundingbox: [-2, 20, 20, -2], axis:
    true, grid: false, keepaspectratio: true});
  A = board.create('point', [8, 3]);
  B = board.create('point', [8, 8]);
  c1 = board.create('circle', [B, 4]);
  D = board.create('glider', [0, 0, c1], {name: 'D'});
  g = board.create('line', [A, D]);
  c2 = board.create('circle', [D, 3]);
  T = board.create('intersection', [c2,g,0], {name: 'T'});

  locus = board.create('locus', [T]);
</script>
```

# Implementation

## Example/Output

# Implementation

## Ready-to-use elements

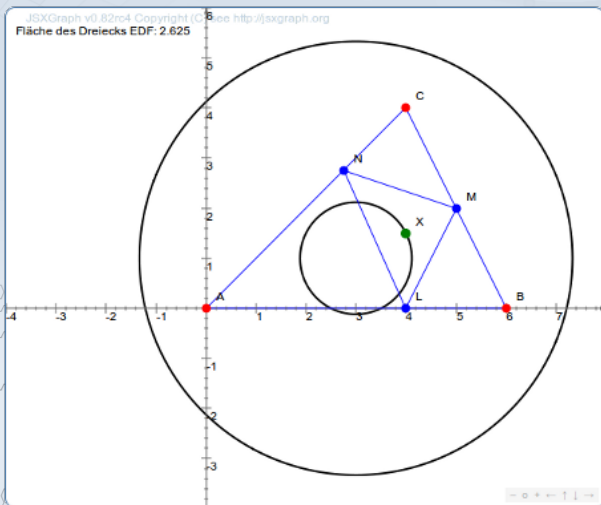

- ▶ Glider on circle and line
- ▶ Intersection points (circle/circle, circle/line, line/line)
- ▶ Midpoint
- ▶ Parallel line and point
- ▶ Perpendicular line and point
- ▶ Circumcircle and circumcenter

# Implementation

Easy to extend

# Implementation

```
<link rel="stylesheet" type="text/css" href="css/jsxgraph.css" />
<script type="text/javascript" src="js/jsxgraphcore.js"></script>
...
<div id="jxgbox" class="jxgbox" style="width:500px; height:500px;"></div>
<script type="text/javascript">
    board = JXG.JSXGraph.initBoard('jxgbox', {boundingbox:[-4, 6, 8, -4], axis:
        true, grid: false, keepaspectratio: true});
    A = board.create('point', [0, 0]);
    B = board.create('point', [6, 0]);
    C = board.create('point', [4, 4]);

    t1 = board.create('triangle', [A, B, C], {strokeWidth: '1px'});

    X = board.create('point', [4, 1.5], {name:"X"});

    L = board.create('perpendicularpoint', [X, t1.c]);
    M = board.create('perpendicularpoint', [X, t1.a]);
    N = board.create('perpendicularpoint', [X, t1.b]);

    t2 = board.create('triangle', [L, M, N], {strokeWidth: '1px'});
```

# Implementation

```
...

X.ancestors[L.id] = L;
X.ancestors[M.id] = M;
X.ancestors[N.id] = N;
X.ancestors[A.id] = A;
X.ancestors[B.id] = B;
X.ancestors[C.id] = C;

X.generatePolynomial = function () {
  var as16 = getTriangleArea(L, M, N),
  as = '((( '+M.symbolic.x+')-('+N.symbolic.x+')^2+(( '+M.symbolic.y+')-('+N.
    symbolic.y+')^2)',
  bs = '((( '+L.symbolic.x+')-('+N.symbolic.x+')^2+(( '+L.symbolic.y+')-('+N.
    symbolic.y+')^2)',
  cs = '((( '+M.symbolic.x+')-('+L.symbolic.x+')^2+(( '+M.symbolic.y+')-('+L.
    symbolic.y+')^2)',

  return [ '4*'+as+'*'+cs+'-('+as+'+'+cs+'-'+bs+')*('+as+'+'+cs+'-'+bs+')-('+
    as16+')' ];
};

locus = board.create('locus', [X], {strokeColor: 'red'});
</script>
```

# Implementation

Re-using locus data: Discovered loci can be

- ▶ intersected with circles, lines, other curves, ...
- ▶ used as a base object for gliding points
- ▶ used for the discovery of other loci

```
var s = JXG.JSXGraph.initBoard('box', {ax:  
var a = brd.createElement('slider', [[1,3],[5  
var b = brd.createElement('slider', [[1,2],[5  
var f = function(x){ return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f:  
function(){ return s.Value(); }  
function(){return a.Value(); }  
function(){return b.Value(); }  
},  
{fillColor:'#ffff00',
```

# Implementation

```
C = board.create('glider', [loc]);
```

```
c2 = board.create('circle', [C, 3]);
```

```
E = board.create('intersection', [c1, c2, 0]);
```

```
F = board.create('midpoint', [C, E]);
```

```
var brd = JSXGraph.initBoard('box', {ax:  
var s = brd.createElement('slider', [[1,3], [5  
var a = brd.createElement('slider', [[1,2], [5  
var b = brd.createElement('slider', [[1,1], [5  
var f = function(x) { return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f:  
function() { return s.Value(); }  
function() { return a.Value(); }  
function() { return b.Value(); }  
},  
{fillColor: '#ffff00';
```

function(){return a.Value(); }  
function(){return b.Value(); }  
},  
{fillColor:'#ffff00'
```

# Optimization

Idea: Divide and conquer

# Optimization

## Transformations

- ▶ Translate the construction moving one point to  $(0,0)$
- ▶ Rotate the construction moving another point onto the x-axis
- ▶ After the Gröbner basis is calculated, the result is retransformed
- ▶ User can choose the two points or
- ▶ JSXGraph chooses two points (but sometimes not the best suited ones)

## Examples

```
<script src="/javascript">  
var brd = JXG.JSXGraph.initBoard('box', {ax:  
var s = brd.createElement('slider', [[1,3],[5  
var a = brd.createElement('slider', [[1,2],[5  
var b = brd.createElement('slider', [[1,1],[5,  
var f = function(x){ return Math.sin(x); }  
var plot = brd.createElement('functiongraph',  
var os = brd.createElement('riemannsum', {f:  
function(){ return s.Value(); }  
function(){return a.Value(); }  
function(){return b.Value(); }  
},  
{fillColor:'#ffff00'
```
